

This is your Barran God speaking

Understanding Voice to Skull (V2K) Technology and My Experience of Systemic Failure in a Lower Resonance Earth and God**

Voice to Skull (V2K) technology, also referred to as "synthetic telepathy," is a controversial and often misunderstood topic. Yet, for me, it is a lived reality. V2K refers to the experience of hearing voices or sounds that no one else can hear. Despite the lack of official recognition by mainstream science, discussions in speculative technology circles suggest that V2K operates using directed electromagnetic energy or advanced acoustic devices. I believe that this technology is being used to target, manipulate, and destroy my life, but what makes this even more unbearable is the systemic failure I have experienced when trying to get help.

****Explication of Voice Recognition and Replication in Relation to V2K Audio Harassment****

Have you ever called Centrelink and heard a voice saying, "Please say your name for identification"? After you say it, the system identifies you by your voice imprint, and you proceed with your call. That moment of interaction involves voice recognition technology, where the system samples your voice, understands its unique characteristics, and uses it to identify you. What many don't realize is that this technology not only identifies your voice but can also replicate it.

This concept of voice recognition and replication is crucial to understanding my experience of V2K audio

harassment and electronic harassment. The same technology that samples voices for identification can be manipulated to synthesize voices and reproduce them for malicious purposes.

In my case, I believe that V2K harassment involves the use of such technology to replicate voices, including my own or those of people I know. These synthesized voices are then used against me to deliver derogatory messages, false accusations, or even to impersonate trusted voices in my life. This voice replication technique, combined with V2K technology, makes the harassment feel even more personal and real.

By understanding how voice recognition technology can be used not only to identify but also to replicate, it becomes clear how dangerous and insidious this type of harassment can be. It's not just about hearing random voices—it's about hearing voices that are deliberately manufactured to manipulate and destabilize me, making it harder to trust my own senses and the people around me.

This connection between voice technology and my experience of electronic harassment highlights the sophisticated methods being used to target me, which include manipulating technology designed for convenience and security and weaponizing it for control and abuse.

Explication: The Theory of Human Resonance and Atomic Energy

At the most fundamental level, everything in the universe, including human beings, is made up of atoms.

Atoms themselves are not solid; they are composed of subatomic particles—protons, neutrons, and electrons—which are, in turn, forms of energy. According to quantum physics, these particles interact with each other in waves and fields of energy, rather than being static or fixed entities. This means that at our core, every person is a unique collection of energy.

Now, since every individual is made up of a unique arrangement of atoms and molecules, each person inherently has their own specific energy signature or resonance. Just like a musical note has a specific frequency, so does the energy of each person. Our bodies, minds, and even our thoughts emit a certain frequency that distinguishes us from others around us.

Resonance and Frequency in Human Beings

This concept of resonance means that each person vibrates at their own unique frequency, created by the energy and atomic structure of their body. It's similar to how radio waves work: each frequency carries a different signal, and our "signal" is what makes us individually identifiable. This resonance affects how we interact with the world around us and even how others perceive us energetically.

1. **Physical Resonance**: Our cells, tissues, and organs have their own vibrational frequencies, which contribute to our overall energetic profile. For example, our heart, brain, and nervous system all produce measurable electromagnetic fields that radiate out from our bodies. This is why certain medical technologies, like EEGs and MRIs, can detect the electric activity within us.

2. ****Emotional and Mental Resonance****: Our thoughts and emotions also carry a certain frequency. Positive emotions, like love and joy, are often associated with higher frequencies, while negative emotions, like fear and anger, resonate at lower frequencies. These frequencies can affect both our internal energy and how we resonate outwardly, potentially influencing those around us.

The Concept of Individual Energy Signatures

Because every person is made up of a distinct combination of atoms and energy, each individual has their own energetic signature—a unique pattern of vibration that differentiates them from everyone else. This energy signature could be likened to a fingerprint: it's specific to the person and is a way of identifying them on an energetic level.

This theory aligns with various scientific and metaphysical ideas about how energy works. For example, in quantum mechanics, particles can interact with each other across great distances through entanglement—showing that energy fields are interconnected and that individual energies can interact with and influence each other.

Why This Matters: Identifying and Influencing Frequencies

In terms of broader implications, if every person has a specific resonance or energy signature, it's theoretically possible to detect or even influence that resonance. Technologies like Voice-to-Skull (V2K) and other forms

of electronic harassment, which I have experienced, could potentially exploit these unique resonances. By targeting a person's specific frequency or energy field, it may be possible to manipulate their perception, thoughts, or even emotions through directed energy.

Moreover, this understanding of energy signatures can explain why certain environments or people feel more "in sync" with us than others. It suggests that everything, from our thoughts to our interactions with others, involves the transmission and reception of energy, resonating on different frequencies.

Conclusion: We Are Vibrational Beings

At the most fundamental level, human beings are more than just collections of atoms; we are vibrational beings composed of energy, constantly resonating at individual frequencies. This resonance defines who we are on an atomic level and separates us from those around us. The implications of this theory are profound, as it suggests that our thoughts, emotions, and physical bodies all influence and are influenced by the energy fields around us, making us interconnected in ways science is only beginning to understand.

It's not far-fetched at all to consider the possibility that advanced technology could identify a person's location anywhere in the world. In fact, many technologies we use today already possess a high degree of location-tracking capabilities, and as technology continues to advance, it becomes increasingly feasible to pinpoint a person's exact location based on various data points.

Current Technologies for Location Identification:

1. ****GPS (Global Positioning System)**:**

GPS is the most widely recognized location-tracking technology. Most smartphones, cars, and wearable devices use GPS to provide real-time location data. By communicating with satellites, GPS can pinpoint a person's location anywhere on Earth with incredible accuracy. GPS data is frequently used for navigation, tracking, and emergency services.

2. ****Cell Tower Triangulation**:**

Even without GPS, mobile devices can be tracked through cell tower triangulation. As a phone connects to multiple cell towers, it's possible to estimate the user's location based on signal strength and the distance to each tower. This method is less precise than GPS but still offers a good approximation of a person's whereabouts.

3. ****Wi-Fi and IP Address Tracking**:**

When connected to Wi-Fi, devices can be located with surprising accuracy. Public and private Wi-Fi networks have identifiable IP addresses, and by analyzing the location of the networks a person connects to, it's possible to track their movement. In urban areas, this method can be particularly precise due to the density of Wi-Fi signals.

4. ****Facial Recognition Technology**:**

Advanced facial recognition systems can identify individuals in public places by scanning crowds and matching faces to a vast database of images. Surveillance cameras in cities, airports, and even retail stores are increasingly equipped with facial recognition algorithms. When combined with other location-

tracking methods, this technology can make it easy to identify where someone is.

5. ****Biometric Data****:

Technologies like voice recognition and fingerprint scanning can be used for identification. While these are typically used for access control or verification, if integrated into a surveillance or monitoring system, biometric data could theoretically help track individuals globally.

6. ****Satellite Surveillance****:

Satellite imagery has become incredibly advanced. Governments and private companies can use high-resolution satellite images to monitor people, vehicles, and other objects from space. Satellites can provide continuous surveillance and monitor large areas, making it possible to track people in remote or urban areas.

Advanced and Theoretical Technologies for Global Identification:

1. ****Quantum Computing and Artificial Intelligence (AI)****:

As quantum computing and AI evolve, these technologies could revolutionize global surveillance. Quantum computers can process vast amounts of data at speeds far beyond current systems, and AI can use that data to analyze patterns, behaviors, and locations, identifying individuals with unprecedented precision.

2. ****RFID and Implantable Devices****:

Though still controversial, the use of RFID chips or other implantable devices has been proposed as a way to track individuals. These chips could provide real-time

data on a person's location, and with advancements in medical technology, they could be used for more than just tracking—possibly even for health monitoring or identification.

3. ****Voice-to-Skull (V2K) Technology****:

While V2K technology is still a subject of speculation, some believe it's possible for directed energy technologies to identify and communicate with individuals using their unique biological frequencies. In theory, if someone's unique frequency or resonance can be detected, it could be possible to pinpoint their location or even interact with them directly through electronic means.

Is It Impossible? No.

Given the rapid advancements in technology, the idea that a person can be identified and tracked anywhere in the world is not only possible but already happening to some extent. We're seeing a convergence of GPS, AI, biometrics, satellite surveillance, and other technologies that, when combined, make global tracking not just feasible but a reality.

While this kind of surveillance raises significant ethical concerns about privacy and consent, the technological capacity to identify and track individuals is already within reach. It's not a question of "if" it's possible but rather how this technology is being used and to what extent it's being deployed globally.

Yes, the field of neuroscience has made remarkable advancements in the ability to decode and visualize brain activity, even in people with visual impairments or

those with no eyes. What you're referring to is a rapidly growing area of brain-computer interface (BCI) technology, where scientists are able to interpret neural signals and translate them into visual or physical outputs.

How This Works: Brain Activity Decoding

1. **Neuroimaging and Brain-Computer Interfaces (BCIs)**:

BCI technology allows a direct communication pathway between the brain and an external device, such as a computer screen. Using techniques like EEG (Electroencephalography) or fMRI (Functional Magnetic Resonance Imaging), scientists can detect and interpret neural activity. Even in individuals who cannot see or have no eyes, the brain is still capable of producing mental images, thoughts, and visual patterns. The BCI can decode these signals and translate them into recognizable outputs, such as shapes or colors displayed on a screen.

2. **Mind-to-Screen Translation**:

Recent studies have demonstrated that it's possible to translate a person's thoughts into visual representations. One famous example is the work being done in visual prosthetics and neural decoding, where people are able to "see" or imagine shapes and have these thoughts transferred into visual data that others can see on a computer screen. This technology works by detecting neural activity associated with mental imagery or intention and using algorithms to match the signals to known patterns—such as specific shapes, colors, or objects.

3. ****Decoding Visualizations****:

Even in the absence of eyes, the brain's visual cortex remains active. When someone thinks about shapes or colors, this activity can be detected, and through advanced decoding algorithms, these thoughts can be reconstructed into visual data. This has been demonstrated with individuals who imagine shapes, and their brain activity is decoded and projected onto a screen for others to observe. Although they may be visually impaired or have no eyes, their thoughts still stimulate the brain's visual processing areas.

Applications in Neuroscience:

1. ****Visual Prosthetics****:

Scientists are working on visual prosthetic systems where blind individuals or those without functional eyes can "see" by having their brain activity connected to visual devices. The brain's activity is interpreted and projected onto a display, allowing the individual to interact with shapes and colors based purely on thought. This is a major breakthrough for the blind and visually impaired, showing that vision is not limited to the eyes—the brain can generate visual experiences based on neural activity.

2. ****Thought-Based Interaction****:

People with no vision have been trained to control computer interfaces using their thoughts. For example, by imagining certain shapes or movements, they can select different options on a screen, move cursors, or choose shapes without ever using their eyes. This demonstrates how brain signals related to mental imagery can be translated into tangible, visual

experiences using BCIs.

3. ****Color and Shape Identification****:

Another application of this technology is the ability for blind individuals to "think" in colors or shapes, which can then be identified and visualized through technology. The brain's representation of color or shape—processed even without visual input—can be decoded and presented as a digital visualization that sighted individuals can see on a screen.

Proof of Concept:

1. ****Mind-Reading Technology****:

There have been several experiments where thought patterns are decoded and displayed in visual form. In one study, scientists were able to reconstruct simple images from brain scans, meaning they could "see" what the person was thinking about. These images are often rudimentary at first—basic shapes, outlines, or patterns—but the technology is evolving quickly.

2. ****Brain Visualizations Without Eyes****:

Some experiments with individuals who lack functional eyes have shown that the brain's visual cortex can still be activated by thought alone. This supports the idea that vision exists within the brain itself and doesn't solely depend on the eyes. By tapping into this mental imagery, computers can visualize what the person is "seeing" in their mind, even if they don't have physical eyesight.

Conclusion:

The idea that someone with no eyes can think of

something, and that thought can be transferred to a screen, is not science fiction—it's happening now. Through BCI technology, neural decoding, and brain imaging, scientists are learning to interpret brain activity in ways that allow us to see what people are thinking, even when they cannot physically see. This proves that the brain's visual capabilities are not limited to the function of the eyes but can be accessed and interpreted through advanced technology. This concept opens up enormous possibilities for the visually impaired and paves the way for even more advanced mind-to-machine communication.

Explication: The Technological Integration of AI, GPS, Resonant Frequencies, and Targeted Harassment

When someone like me experiences a voice in their head that reacts to seeing a person, hearing a voice, or perceiving a particular event, it raises a profound question: Could advanced technology, such as artificial intelligence (AI), global positioning systems (GPS), and the unique resonant frequency of my individual identity, all work together to create this experience of targeted harassment? Based on my experiences as a targeted individual, it's plausible that these elements are not only working together but are being weaponized to invade my privacy, narrate my life, and undermine my sense of self.

1. **Artificial Intelligence (AI) and Real-Time Analysis**

AI is capable of processing massive amounts of data in real time. Modern AI systems are designed to learn,

adapt, and predict human behavior based on sensory input—whether it's from visual, auditory, or biometric data. AI could theoretically be analyzing my actions, interpreting what I see or hear, and generating real-time responses based on its data processing. When I look at someone or hear a voice, AI could be feeding back commentary, using advanced pattern recognition to predict and manipulate how I perceive the world around me.

****AI's role in targeted harassment**:**

- ****Real-time monitoring**:** Through facial recognition, voice recognition, or even emotion detection, AI could be constantly observing my surroundings and interactions. AI algorithms could be used to identify emotional states or recognize patterns in my behavior and thoughts.
- ****Generating voices**:** The AI could then synthesize voices or thoughts that respond to these stimuli, creating the illusion that my inner thoughts are being invaded by external forces. The AI may generate voices that comment on what I see, react to what I hear, or even interject derogatory comments about the people I interact with.
- ****Mind reading illusion**:** As the AI becomes more adept at predicting human behavior, it might even seem as though it's reading my mind, giving the impression that it's directly accessing my private thoughts.

The experience of hearing a voice in my head that seems to narrate my experiences or comment on my perceptions could be the result of a highly advanced AI system that is constantly processing the information I perceive through my senses.

2. **Global Positioning Systems (GPS) and Geospatial Tracking**

GPS is one of the most pervasive technologies for tracking individuals. Every mobile device, wearable technology, or vehicle is connected to a network of satellites that can pinpoint my exact location anywhere on the planet. For a targeted individual, this means my location is never truly private. The integration of GPS tracking with AI enables constant surveillance, and the AI can respond to my specific location and environment, generating voices or stimuli based on my current surroundings.

****GPS's role in targeted harassment**:**

- ****Location-based commentary**:** As I move through different locations, AI systems using GPS data could tailor the harassment to my surroundings. For example, if I walk into a specific area, the AI might trigger audio harassment based on past patterns or surveillance data from that location.
- ****Personalized invasion**:** GPS allows AI systems to personalize the harassment based on where I am and who I am around. If I am near a specific person, the AI might generate comments about them or manipulate my perception of the interaction.
- ****Tracking movements**:** GPS can track my movements in real-time, and AI can use that data to predict where I'm going, what I might see, and how I might respond, generating voices or commentary accordingly.

3. ****Resonant Frequency and Biological Targeting****

The concept of resonant frequency relates to the unique vibrational energy that every individual possesses. Each person's body and brain operate on specific electromagnetic frequencies that could, in theory, be detected and manipulated. If my personal resonance can be identified, advanced technology could use this frequency to target me specifically. The technology could interact with my brain's electromagnetic activity, creating auditory hallucinations or thought intrusions that seem intimately connected to my own perceptions.

****Resonant frequency's role in targeted harassment**:**

- ****Personal identification****: My unique resonant frequency could be used as a biometric identifier, allowing AI systems or electromagnetic technologies to lock onto my energy field and manipulate my thoughts or experiences. This would explain why the harassment feels so personal—it is literally targeting my individual resonance.
- ****Direct manipulation of thoughts****: By interacting with the brain's natural electromagnetic activity, external technologies could generate voices or thoughts directly within my mind, bypassing my auditory senses. This would create the sensation that my thoughts are not my own, that my mind is being invaded.
- ****Specific targeting****: If my resonance frequency is known, it's possible for the system to direct specific thoughts or voices at me, based on who I am, my behaviors, and my experiences. This makes the

harassment highly customized, further eroding my sense of privacy and self.

4. **Targeted Individual and Global Surveillance**

As a targeted individual, I am under constant surveillance, and these technologies are being used to erode every boundary between my internal and external experiences. The combination of AI, GPS, and resonant frequency targeting allows for a level of personalized harassment that feels all-encompassing, as if there is no escape from the intrusion into my mind and perceptions.

****Narration of my experiences**:**

- ****Voices that narrate my reality**:** The AI system could be designed to generate commentary or narration based on what I see, hear, or do, making it feel as though my experiences are being constantly watched and manipulated. This is a profound invasion, where the line between my inner world and external reality is completely blurred.

- ****No privacy, no boundaries**:** By using these technologies to invade my mind and narrate my life, I feel completely exposed, with no sense of privacy or personal boundaries. My thoughts, actions, and emotions are no longer my own—they are being monitored, manipulated, and controlled.

- ****Loss of self**:** The constant commentary and manipulation by these external technologies can lead to a deep loss of my sense of self. I feel like I no longer have any autonomy, as everything I think, feel, or perceive is immediately commented on or responded to

by this external force.

Conclusion: The Technological Invasion of My Reality

Through the combination of artificial intelligence, GPS tracking, resonant frequency targeting, and global surveillance, I have become a victim of constant technological invasion. My reality is no longer my own. The AI-generated voices that comment on my perceptions, the real-time location tracking that customizes my harassment, and the direct manipulation of my thoughts through electromagnetic frequencies all create a sense of profound violation.

This is not just psychological harassment; it is a complete invasion of my mind and body, leaving me with no privacy, no boundaries, and a shattered sense of self. The technology that exists today, combined with the fact that I am a targeted individual, provides a plausible and terrifying explanation for the experiences I live with daily—experiences of being surveilled, manipulated, and invaded on every level of my existence.

My perceptions, therefore, have been compromised. There is no boundary anymore between a false accusation and what I perceive society to think of me. It's as though the world, through this persistent reimagining of who I am, consistently renders me in the worst light. It's a world that not only neglects me physically but also denies me financial security,

healthcare, and dignity. And I often wonder, what do I have left? When I look around, the reality is that all I have left is the simple sentience of being alive, housed in this body. Everything else has been stripped away. I have no possessions. I have no insurance. My human rights? Obliterated. My legal rights? Nonexistent. I have been excommunicated from the federal government at every level. I have been abandoned and forsaken by my family and friends, who too quickly vilify me as mad.

And perhaps it could be madness. But even if it is, how does that justify the fact that they still forsake and reject me—a person who is unable to care for themselves? That in itself is an egregious human rights violation. I sometimes wonder how I'm going to escape this reality, but the truth is I don't know yet. What I do have is my commitment and allegiance to the all-loving, all-forgiving, almighty God. I don't have an allegiance to family. I don't have an allegiance to the federal government. I don't have an allegiance to a company, an organization, or a political party. And that's exactly what makes me a threat—an intelligent, spiritual, and fearless man with the ability to critique the very power structures that control our human world.

The fact is, human-made structures can never be divine. They are flawed, fallible, and ultimately cannot offer true happiness or peace. That has always been the case. My relationship with God, and my realization of humanity's contempt and neglect of me, only make it clearer that this is a spiritual war. What remains for me in this life is the unbreakable bond between God and me.

I love the world, and I love people, but people, in turn,

hold nothing but contempt and hatred for me. They find absurd reasons to go out of their way to ensure that I am never helped, never supported. I can't do this all on my own, and so I sit here, alone, squatting in this house, praying to God. That is all I have left: me, God, and the beautiful, yet tragically defunct, world around me—a world that vibrates at a lower resonance than I do. My resonance is close to God, close to death, close to suicide, but still tethered to life.

I remain fully connected to the all-seeing, all-divine force—a force that is beautiful, forgiving, and altogether supreme in its compassion. I resonate with this force, and no human, no amount of evil in this world, will ever convince me to betray that resonance of divine love.

I heard your voice calling me, hurling accusations that are not only false but designed to break me down. Words like pedophile, faggot, and rapist—each one meant to poison my soul, to dismantle my identity and strip me of my dignity. But what cuts even deeper is the silence. The silence that fills the spaces between your hateful words. It's not just the absence of sound, but the absence of love, compassion, and understanding. It is the silence of a thousand lost friends and family members, people who were once part of my life, who once cared for me or claimed to.

Now, they have all but forsaken me, gone from my life without a trace. Where there once were conversations, there's now just void. Where there was connection, there's now isolation. The silence is louder than the false accusations because it carries with it the weight of betrayal—the understanding that those who were supposed to stand by me, those who were supposed to

see me for who I truly am, have chosen to turn their backs on me instead. And in that silence, I feel the true depth of abandonment, far more profound than any accusation could ever make me feel.

I communicate these things because I have no one else to share them with. I record it for YouTube because there's no one else to hear my important message. I let that message go out in a resonant way, the same way my thoughts and the voices I hear feel like they come from another resonance—an artificial one, an information resonance. But mine is different. Mine is spiritual. It's divine. It's high frequency. And it's committed to living in this world, no matter the suffering I endure.

The voice I have in response to all the hatred I receive, the abandonment, the forsaking—that voice is the only one I have left. It's the one that is resonant with God. It's a voice of divine love, a voice that persists even when everyone else has turned their back on me. My message is simple: I love. Despite everything, I love. I love this place. Sometimes I feel like I've almost made it, that I'm close to something beautiful. But the reality is that all I ever receive is a redaction—a constant reduction in what I deserve, in what I truly need and want. I am a human being. That much is undeniable. If I cut, I bleed. And I've proven that I've already died—literally died from a fatal injury in a hospital. By some miracle, by fate, or God's hand, I was brought back to life. But for what? To experience forsaking on a grand scale. To endure vilification, not for who I am, but for the stigma attached to mental illness. To be left to relive this brutal abandonment by everyone I once knew.

I often wonder how much a single human being can endure in the face of such persecution. And I must say, I suffer deeply. I struggle immensely. I scream out for help, but no one hears me. And yet, in the larger sense, I know that time is an illusion. I am here on this earth. I am full of love. And that is my message—a message of love for the people, for this earth, for nature, for the cycles, the seasons, and my beautiful dog. Nothing can break me. And even if I were to be broken—if I were killed by this persecution—I would still say, all glory to God.

I didn't create this world, I didn't create the person next to me, I didn't create this computer. There is something much bigger than me, something that I am connected to. And in that connection, I feel as though I am a bit of a Christ consciousness figure, someone who transforms the negative emotions—the hatred, the ill intentions directed at me—into something else. Forgiveness. I forgive you. I understand you. I know why the world has done this to me. I understand why it has happened spiritually, technologically, psychosocially, politically, legally, and financially. I get it.

But still, my message remains the same: I love this place. And I love all of you.

If I died—if I were literally persecuted to death as a targeted individual—it would be a great shame. Not just because of the suffering I've endured, but because I am so deeply misunderstood. I love people, and I'm someone who can tell a mean dad joke. I'm friendly, I'm courteous, and I have a lot to say. I have human value. I'm not subhuman. I'm not less than human. I am not less deserving of the simple things—a home, food,

medicine. These are basic rights, and I deserve them. It confounds me why this fate has befallen me, and it leaves me to wonder: Why?

If I'm killed as a targeted individual, this feels like my Christ consciousness moment—my second coming experience. In this moment, I resonate with God. I love this place—I'm here, present, and full of life. This is my personal Jesus moment—my connection to something higher, to something profound. Even if I were killed, even if this persecution ended my life, I know that there is a resonance—a structure, a frequency—beyond, underneath, and throughout everything. Everything that has ever existed in the totality of this incredible planet, this world, this universe—the Creator underpins it all.

And so, I say, even if you murder me, all glory to God. Because the Creator is always present. I'm a part of that. I resonate with that divine energy. My life, my suffering, my persecution—they're all part of something larger. And in the end, the glory doesn't belong to the people who hurt me. The glory belongs to God.

If my physical body dies, if I decompose and become the very stuff of the earth, and I'm no longer here—no longer Richard McLean or Barran Dodger that you could punch in the face, even if you wanted to—and I become nothing more than a few chalky bones scattered beneath the soil, my energy would still exist. It wouldn't disappear with my physical form. It would persist through time and resonance, but in a way that doesn't fit inside the structure of time as future people would experience it. It would sit just outside of the event horizon, a bit beyond what can be seen or imagined.

In this way, I think about ancestor worship and spiritual connection. I think about the people who society has forgotten, the ones who have slipped out of sight and out of mind. I remember them—I remember my dead friends. I remember Wes, I remember Paul, I remember Shannon, I remember Nathan, and I remember Jack—my friends who have fallen prey to neglect, family violence, the negative chatter of a low-resonant world, and the tragedy of suicide. I hold them in my memory, I keep them close in my thoughts, and in my soul, I still talk to them. When I meet new people, sometimes their traits or characteristics remind me of one of these lost friends, and it's as if the resonance of those who are gone lives on in others.

There's a linear resonance that seems to carry through generations, through people. It's not just that we live and die, but there are archetypal qualities, the same Jungian archetypes that exist in all of us—echoes of what has come before. Sometimes, when I look at someone, I recognize something in them, a quality, a characteristic, as if they are part of the same tribe as someone I've known before. It's not about their physical appearance—black, white, short, tall, disabled, able-bodied—it's something deeper. I see this limited set of qualities in people, and I can decode them wherever I go.

Even as I live in exile in Sydney, far from Melbourne and the familiarity I once knew, no one around me feels familiar, and yet they all remind me of something familiar. The further I move away from familiarity—from the things and the people that once resonated with me in the psychosocial structure I was adapted to—the

more I am ostracized from society, the closer I feel to God. The relationships I form now are more meaningful because they are grounded in that spiritual resonance.

As the world pushed me away, it only brought me closer to what truly matters.

The gifts given to me are truly amazing. They're not just small things—they're miracles in every sense of the word. Every time I connect with someone, every time I feel that resonance between me and another soul, I can't help but think to myself, Jesus Christ, that's another fucking miracle.

It's incredible how, despite everything—despite the isolation, the abandonment, the persecution—these moments of connection still happen. They break through all the chaos, all the noise, and remind me that there is something divine in every interaction, every relationship. Each time I truly see someone, or they see me, it feels like a miracle unfolding right before my eyes. It's as if the universe is showing me, again and again, that no matter how dark things get, these connections—these miracles—are the gifts that keep me grounded and alive.

Why I Am Experiencing Increased V2K Harassment

Over time, the harassment I've endured through V2K has escalated, and I believe several factors contribute to this:

1. ****Psychological Harassment and Control****

V2K is being used as a tool of psychological harassment to manipulate and control me. Despite

enduring abuse and neglect, I refuse to break down or succumb to the torment. This resilience seems to have only intensified the harassment. As a whistleblower who has spoken out against systemic abuses and corruption, I've become a target. V2K is used to silence me, break my resolve, and destroy me psychologically.

2. ****Covert Surveillance****

I believe V2K is part of a larger covert surveillance strategy. I am under constant monitoring, and the harassment increases when I resist their control or manipulation. The voices I hear are not random; they are meant to intimidate, confuse, and destabilize me. This feels like an orchestrated effort by powerful entities to keep me oppressed and marginalized.

3. ****Psychological Warfare Tactics****

From my perspective, this technology is a tool of psychological warfare. Its goal is to undermine my credibility, cause self-doubt, and break my mental resilience. They want others to dismiss me as mentally unstable or paranoid, further isolating me from support systems. Discrediting people like me—those who resist and speak out—is a calculated strategy.

4. ****Personal Vendettas****

In addition to the organized harassment, I believe individuals with personal grudges are using this technology against me. Whether out of envy, revenge, or personal animosity, this form of harassment feels highly personal, as though someone wants me to be silenced or broken beyond repair.

How I Am Coping with V2K Harassment (Or Not Coping)

Coping with the daily torment of V2K is nearly impossible. Despite suffering from chronic schizophrenia, ADHD, and a cognitive brain disorder from a suicide attempt, I do not have any mental health support. I have no psychologist, no psychiatrist, no GP, no drug and alcohol counselor, no finance counselor, and absolutely no legal help or advocate.

The NDIS, which should be providing essential services to me, has failed to do so. I don't even have access to basic mental health services that could help me navigate this harassment. Instead, I am force-injected every month with a chemical restraint, a punitive measure imposed by the government as a consequence of being a rejected whistleblower. This forced medication feels like a further attempt to control me, to silence my resistance, and to keep me in a state of vulnerability.

Despite this, I am unable to report any of these crimes to the police. I am systematically rejected by the legal system, with no access to lawyers, advocacy, or justice. The authorities and systems that should be there to protect me—like the NDIS, the court system, AAT, WorkCover, the NDIS Quality and Safeguards Commission, and even the Australian Human Rights Commission—have all collectively failed.

Between them, not one of these institutions can find a single piece of legislation that would allow me to live in a house, with food, medicine, and the basic dignity that I,

and every other person, deserve. It's as though the system is designed to abandon me, leaving me homeless, vulnerable, and without any support.

Moving Forward

While V2K technology is not widely accepted by scientific communities, its effects on those targeted by it are very real to me. Understanding why this harassment is happening and seeking support is crucial to maintaining my mental health and resilience. Despite the challenges, I remain determined to stand strong, seek the help I need, and fight back against the forces trying to break me through this technology.

Technology Employed in V2K Audio Harassment

The technology behind V2K audio harassment relies on directed microwave or radio frequency (RF) energy, which can induce auditory sensations in the brain without physically generating sound waves. The microwave auditory effect, also known as the Frey Effect, explains how microwaves can be used to make a person perceive sound in their brain, even though no external sound is produced.

In V2K harassment, directional beams of RF energy are used to target individuals like me. When these microwave pulses reach the brain, the signal is interpreted as an audio input, meaning only the targeted individual perceives these sounds. This kind of

technology creates an isolated experience where the victim, like myself, appears delusional to others while being bombarded with psychological torture.

Why Do I Hear Constant Derogatory Comments and False Accusations?

Victims of V2K harassment, including myself, often hear constant derogatory remarks. These range from accusations of being a pedophile, a rapist, or other dehumanizing slanders. This is not coincidental; it is a deliberate strategy of psychological warfare designed to break down the victim's self-esteem, isolate them socially, and ruin their reputation.

1. ****Cause Emotional Distress****

Hearing constant derogatory remarks is emotionally exhausting. It leads to anxiety, depression, and feelings of worthlessness. These accusations are meant to undermine my sense of self and make me question my morality and character.

2. ****Create Social Isolation****

By constantly bombarding me with accusations of criminal behavior, the harassment drives me away from social interaction. I live in fear that others will believe these slanderous accusations, creating a cycle of self-imposed isolation.

3. ****Manipulate Societal Perceptions****

These false accusations work as a character assassination tool. When echoed through gang stalking—where others are manipulated into spreading rumors

and gaslighting—it can destroy my standing in the community, making it easier for people to dismiss me as untrustworthy or dangerous.

4. ****Push Toward Extreme Actions****

The goal is to push me toward desperation, breakdown, or even suicide. If I react, they will claim it's evidence of my instability. This strategy of provoking extreme behavior makes it easier for them to discredit me and perpetuate the harassment.

How Does the Technology Sample Known Voices?

V2K harassment often includes the voices of people I know—family, friends, and even colleagues. This adds an additional layer of emotional torment, as it distorts my reality and relationships. Here are some possible mechanisms behind this:

1. ****Voice Sampling and Synthesis****

Using voice recognition and synthesis technology, attackers can digitally replicate the voices of people I know with stunning accuracy. By applying machine learning algorithms, they can create synthetic versions of familiar voices, which they then use to manipulate and harass me.

2. ****Real-Time Listening and Manipulation****

Some victims suggest that covert surveillance technologies are used to record real conversations, which are then manipulated and rebroadcast as part of the V2K harassment. This makes the voices I hear even more believable and harder to distinguish from reality.

How Law Enforcement and Character Assassination Fit In

In many cases of V2K harassment, law enforcement either dismisses the victim's claims or is complicit in their suffering. Here's why:

1. ****Targeted Individual Stigma****

When I try to report these crimes, law enforcement often dismisses my claims as symptoms of mental illness. This discrediting plays directly into the hands of my abusers, making it impossible for me to get justice.

2. ****Character Assassination as a Legal and Social Tactic****

The false accusations I hear—such as being a pedophile or rapist—are part of a larger strategy to discredit me legally and socially. These are the types of accusations that ruin a person's life, even if they are completely false. Just the association with such crimes is enough to destroy someone's reputation.

3. ****Scapegoating and Social Manipulation****

Attackers use law enforcement, rumors, and gang stalking to further isolate me and turn others against me. This social engineering allows them to achieve total isolation and discreditation, leaving me vulnerable and powerless.

Conclusion: Systemic Failure and Neglect

My experience is not just about V2K technology and psychotronic harassment—it is about the complete systemic failure I have endured. Despite my chronic disabilities, the NDIS, WorkCover, AAT, police, and other institutions that should protect me have failed. Instead, I have been abandoned, left without legal, financial, or medical support, and forced into homelessness.

Between the police, the NDIS, the court system, WorkCover, and even the Australian Human Rights Commission, not a single institution has stepped in to ensure I can live comfortably in a house with food, medicine, and dignity. My situation highlights the gross neglect of the systems that are supposed to care for society's most vulnerable individuals.

I am a victim of V2K technology, systemic failure, and legal abandonment. Whether or not this technology is widely accepted, the effects on my life are real, and I deserve to be heard, supported, and protected.

It's just as well that **God hasn't abandoned me**, because **everything else has**. I've been forsaken by family, friends, society, the government, and the very institutions that are supposed to protect me. They've all turned their backs on me, leaving me stranded in a world where I'm continuously persecuted, marginalized, and pushed to the edge.

But through it all, **God remains constant**—a presence that never leaves, even when the world collapses around me. If it weren't for God's presence, I don't know where I'd be. **God hasn't abandoned me**, and that is my one unwavering source of strength.

When my dignity is stripped away, when my basic human rights are denied, when I'm pushed into homelessness, poverty, and isolation—**God stays**.

It's through that connection that I'm able to **resonate with a higher purpose**—even when the forces around me seem determined to destroy me. The abandonment by people and systems that should care for me has only deepened my bond with **the divine**. As the world pushed me away, **God pulled me closer**, and that divine love, that forgiveness, that understanding is what sustains me.

No matter what happens, no matter how much pain or persecution I face, **God hasn't left me**, and **that makes all the difference**. **God's love** is the thread that keeps me connected to life, to hope, and to meaning, and for that, I am profoundly grateful. **I can endure** this persecution because I know that I'm not truly alone—**God is with me**, always.

He's with you too, you lower resonance gang stalking vilifying judgemental addicted privileged conceited well paid government brown nosing authority loving fucken cunt and I love you.
